Airbrush has more tools than most other apps, but it's still enough for most effects. You can make precise adjustments –there are lots of adjustment tools– and it's smart enough to know when to make things lighter/darker contrasted to adding more of whatever color you're dragging down over a face, for example. But I can't accurately say how great Airbrush is because I haven't sketched in it long. Studio Fix-It screen lets you select and tweak the most common and annoying problems in photos (like lens or sensor dust), add layer masks, or correct color and exposure. It's not a replacement for Photoshop's excellent Getting Started lessons (they're included on CD), but it may be indispensable if you aren't up to switching apps. It's quick, and can be a big time-saver. For the image shown above, I didn't really have to do much except the basic, simple fixes like brightness/contrast/color to get an easy, good-looking final version. The desktop apps include more advanced controls, but it's a slightly-more-work approach. Photoshop is more like a laboratory whereas the iPad apps are more like a toolbox. Photoshop Sketch, surprisingly, can be a complete, in-depth part of the workflow for larger projects. This does not include Amazon's Kindle Cloud Reader or Kindle Software. In theory, it's a good idea, but in practice, it is unreliable and frequently crashes. You can create and download documents, with a little bit of formatting. The files appear in a directory structure which you have to manually navigate to. You can create links, but there is no functional sharing. Even if you use the technical option of exporting a link to a "local file" on the iPad, it's still only for you and not to an online repository.

Before you can duplicate a layer or enable a layer blend mode and give it a name, you need to open the Layers panel. There are many ways to do this. One way is to double-click on the layer thumbnail while you have the Layers panel visible. A new panel will drop out with the Layers panel open, and you will be able to see and work with the various layers. To duplicate a layer, simply drag in the duplicate icon at the top of the panels. Selecting this symbol selects the duplicate layer and moves it up one level in the Layers panel. You can now work with this duplicate layer the same way you would with the original layer. OK, here is a quick example. Note that you can now navigate as you would on the original layer. You can move, resize and rotate the duplicate layer. There is also a new panel on the right that lets you name the duplicated layer. You can use this new panel to give the duplicate a different name in order to keep the original layer and the duplicate separate. The duplicate layer is now named Smart Sharpen with a checkmark, so the name of the original layer is now changed to Unsharp Mask. You can see a preview in the Layers panel. You can adjust the Sharpen setting on the new layer as you would on the original (or you can apply it to all layers). You can also enable layer blending modes to create different looks for the duplicate layer – For example, you could apply three different blending modes, and then further adjust each layer in the Layers panel to give each layer a different look.
